

Final Term Project II

Two-Rooms Escape Game

1. Game Rules

The player controls a character navigating within two distinct rooms arranged sequentially. Movement is grid-based and confined by room boundaries and obstacles, preventing the player from moving through walls or locked doors. Interaction with objects occurs when the player moves onto an object's location and activates the interaction command. Items discovered through interactions are automatically added to the player's inventory. Inventory items can be applied to locked doors or other interactive objects to unlock progression pathways.

The game is linear; the player must solve the puzzle in the first room to gain access to the second room and then solve the second room's puzzle to escape. Attempts to pass through locked doors without the necessary item result in on-screen feedback indicating that the door remains locked and hinting at required items.

The player interface continuously displays the current inventory, allowing the player to track collected keys and tools. Puzzle clues and messages appear as text overlays or dialogue boxes, guiding the player without explicit handholding.

2. Room 1: The Foyer Puzzle

The Foyer is a rectangular room bounded by walls, featuring a locked exit door on the north wall. This room contains five colored floor tiles arranged in a row near the center of the room. The puzzle requires the player to step on these tiles in the correct order to reveal a hidden Rusty Key.

Upon entering the room, the player receives a hint displayed as a text message in the game interface:

"Try stepping on the tiles starting with the cool colors before the warm ones."

The player must interpret this hint and step on the colored tiles in the correct sequence: **Blue, Green, Yellow, Red, and Purple**. Stepping on the tiles in this exact order triggers the opening of a hidden compartment, revealing the Rusty Key. The key is automatically added to the player's inventory and is required to unlock the door to the next room.

If the player steps on an incorrect tile, the sequence resets, and a message prompts the player to try again, encouraging experimentation and memory to solve the puzzle.

3. Room 2: The Laboratory Puzzle

The Laboratory introduces a more complex challenge designed to test logic and problem-solving abilities. The room includes two primary interactive elements: a computer terminal and a locked glass cabinet.

The player approaches the computer terminal and initiates interaction, which presents a password puzzle. The terminal displays a scrambled word—an anagram—that the player must decode correctly to gain access. The correct password is the original word before scrambling, serving as the key to unlock the cabinet.

Once the player inputs the correct password, the cabinet unlocks automatically. Interaction with the now-unlocked cabinet reveals a Keycard inside, which is then added to the player's inventory. This Keycard serves as the final key to the game's exit door.

The exit door remains locked until the player applies the Keycard to it. Upon successful use, the door unlocks and the player may exit the Laboratory, thereby escaping and completing the game.

4. Summary of Puzzle Flow

The player must first complete the colored tile sequence puzzle in the Foyer to obtain the Rusty Key. This key is essential for unlocking the door to the Laboratory. Upon entering the Laboratory, the player must solve the terminal's password puzzle by unscrambling the given clue to unlock the cabinet. Retrieving the Keycard from the cabinet enables the player to unlock the final door and escape.
